

OASI bounded cognition-to-effect pipeline

1. Slow cognition
hypothesis, intention, and plan

2. Typed PolicyIR
domain, budget, roll-back, evidence obligations

3. Obligation-checked compilation
tests, proof obligations, and validity envelope

4. Reflex + body-bound lease
identity, epoch, generation, principal, resource, action

5. Shadow / canary execution
observe without protected effect

6. AERA commit gate
re-read and revalidate immediately before effect

7. Bounded effect
receipt, provenance, rollback handle

Authority boundary. Learning does not become authority by confidence or repetition. A proposal must be typed, bounded, reviewable, and revocable.

Epistemic firewall. Evidence generated under an active reflex is policy-conditioned and cannot directly justify expansion of that reflex.

Last-mile mediation. Immediate revalidation closes the gap between an earlier check and the bytes, body state, and authority consumed by the effect.

lease invalid

canary mismatch

commit rejected

anomaly

Quarantine / revoke
request independent evidence

Cognition may propose and learn; the constitution alone mediates authority, commitment, and revocation.
